

PHYS 597A: Graphs and networks in systems biology

Project assignment 2, due Tuesday April 9

This assignment represents the first component of your term project. The goal is to write a first draft of your paper, with a clear motivation and definition of the project, presentation of preliminary results and expectations about the final results. If you are writing a review then describe the topic, give a list of articles and review the most important ones. The more you do at this stage, the more clearly you will be able to see how much work remains. My expectation is that this draft will be about two pages long (it can be longer of course).

As you know, the second component of your project will be an in-class presentation during the last two weeks of the semester, and the third component is the final paper due on May 5th. The breakdown of the project grade will be 20% for the first draft, 30% for the presentation and 50% for the final paper.
